

Task		Classification	Rationale
1. The 5 daily prayers (Salah)	Just me	Just me	A deeply personal, spiritual, and meditative practice that requires physical presence, intention, and zero technology intervention.
2. Agility workout	Just me		Physical execution, muscle memory, and athletic conditioning can only be performed by my own body.
3. Consuming/filtering reels & short-form media	Just me		Purely personal entertainment and quick dopamine decompression driven by individual interest.
4. Meal preparation and consumption (3 meals)	Just me		A fundamental biological necessity requiring physical eating, though macro tracking could be automated later.
5. Executing the daily core "productive thing"	Just me		Deep work and high-level execution require my own cognitive focus to build actual capability.
6. Designing core algorithmic logic / proof steps	Just me	Fully automate	AI often glosses over edge cases or hallucinates valid proofs, which destroys deep logical understanding.
7. Writing boilerplate code (e.g., Express routes, DB schemas)	Fully automate		Highly predictable, repetitive code structures that follow a fixed pattern every time.
8. Generating mock data for database testing	Fully automate		Scripting or prompting for 500 rows of structured JSON data takes seconds and requires zero cognitive effort.
9. Writing unit tests for standard utility functions	Delegate with review		AI handles boundary conditions and edge cases quickly, but I must verify test coverage.
10. Drafting weekly status updates for group projects	Delegate with review		Speeds up professional phrasing; requires only a quick sanity check before sending.
11. Brainstorming system design for side projects	Collaborate with AI	Collaborate with AI	Acts as a solid sounding board for analyzing pros, cons, and trade-offs of different tech stacks.
12. Parsing dense API documentation for specific syntax	Collaborate with AI		Speeds up the search for specific parameters, though I double-check the source when errors occur.
13. Debugging cryptic runtime errors or stack traces	Collaborate with AI		Helps isolate the potential cause faster by matching patterns, but requires my system context to fix.
14. Refactoring legacy or messy code for readability	Delegate with review		Excellent at applying clean code principles and style guides, but logic preservation must be tested.
15. Creating flashcards from textbook chapters	Fully automate		Parsing a markdown chapter and outputting Q&A pairs is a deterministic extraction task.
